            -i- PATHWAY: THIS IS THE RATE-LIMITING ENZYME IN THE BIOSYNTHESIS OF SEROTONIN IN THE CENTRAL MERVOUS SYSTEM AND CATALYZES THE FIRST STEP OF THE SYNTHESIS OF MELATONIN IN THE PINEAL GLAND.
-i- SUBDNIT: MULTIMER OF IDENTICAL SUBUNITS.
-i- ALTERNATIVE PRODUCTS: 2 ISOFORMS; 1 (SHOWN HERE) AND 2; ARE PRODUCED BY ALTERNATIVE SPLICING.
-i- TISSUE SPECIFICITY: ISOFORM 2 SEEMS TO BE LESS WIDELY EXPRESSED THAN ISOFORM 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Phosphorylation; Alternative splicing.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA Res. 7:331-338(2000).
-!- CATALYTIC ACTIVITY: L-phenylalanine + tetrahydrobiopterin + O(2) =
-Ltyrosine + dihydrobiopterin + H(2)O.
-!- COFACTOR: Binds 1 ferrous ion (By similarity).
-!- COFACTOR: Binds 1 ferrous ion (By similarity).
-!- PATHWAY: Catabolism of phenylalanine; first (rate-limiting) step.
-!- SIMILARITY: BELONGS TO THE BIOPTERIN-DEPENDENT AROMATIC AMINO ACID
HYDROXYLASES FAMILY.

CATALYTIC ACTIVITY: L-tyrosine + tetrahydropteridine + C dihydroxy-L-phenylalanine + dihydropteridine + H(2)O. COFACTOR: FERROUS ION.

ENZYME REGULATION: PHOSPHORYLATION LEADS TO AN INCREASE CATALYTIC ACTIVITY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY: BELONGS TO THE BIOPTERIN-DEPENDENT AROMATIC AMINO ACID HYDROXYLASES FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     PATHMAY: Catecholamine biosynthesis; first step.

X STANCTURIAL Baiss of autorequilation of phenylalanine hydroxylase.";

NAT. Struct. Biol. 6:442-446 (1999).

-1-CYTALYTIC ACTIVITY: L-phenylalanine + tetrahydrobiopterin + O(2) =

-1-tyrosine + dihydrobiopterin + H(2)O.

-1-CATALTIC ACTIVITY: N-TERMINAL REGION OF PAH IS THOUGHT TO CONTAIN

ALLOGYTOR: DOMAIN THAT REGILATES THE ACTIVITY OF A CATALYTIC

DOMAIN IN THE C-TERMINAL PORTION OF THE MOLECULE.

-1- PATHWAY: CAtabolism of phenylalanine; first (rate-limiting) step.

-1- SIMILARITY: BELONGS TO THE BIOPTERIN-DEPENDENT AROMATIC AMINO ACID

-1- SIMILARITY: BELONGS TO THE BIOPTERIN-DEPENDENT AROMATIC AMINO ACID

-1- SIMILARITY: BELONGS TO THE BIOPTERIN-DEPENDENT AROMATIC AMINO ACID

Tyrosine 3-monooxygenase (EC 1.14.16.2) (Tyrosine 3-hydroxylase) (TH).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Waterston R.;
Submitted (NOV-2001) to the EMBL/GenBank/DDBJ databases.
-!- CATALYTIC ACTIVITY: L-tyrosine + tetrahydropteridine + O(2) = 3,4-dihydroxy-L-phenylalanine + dihydropteridine + H(2)O.
-!- COFACTOR: FERROUS ION.
-!- PATHWAY: Catecholamine biosynthesis; first step.
-!- PATHWAY: BELONGS TO THE BIOPTERIN-DEPENDENT AROMATIC AMINO ACID HYDROXYLASES FAMILY.

                                                                                                                                                                                                                                                                                                                                                        ACTIVITIES:

CATALYTIC ACTIVITY: ATP + a protein = ADP + a phosphoprotein.

SUBCELULLAR LOCATION: CYTOSKELETON.

ALTERNATIVE PRODUCTS: 2 isoforms; a long form (shown here) and short form; are produced by alternative splicing.

SHAULARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE SER/THR FAMILY OF PROTEIN KIRASES.
                                                                                                                                                                                                                                                                                                                                  SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS SUPERFAMILY.
